

blogging through email, continued

Worked a bit on the blog by email stuff. Sanitized the script a bit. The posting should now be a bit more clean as the backend now only includes stuff between the body tags of the received html. Nowhere near rock-solid, but useable nevertheless.

Just for the technically inclined, this is the regexp used to extract the blog entry from the html:

```
!<body[^>]*>(.*?)</body>!
```

Next step, getting some regular expression which makes sense to extract excerpt and extended entry (if any) out of there. Thinking about using

as a separator; it just looks natural when composing the entry. Dunno.
