

Front lower wishbones part deux. . .

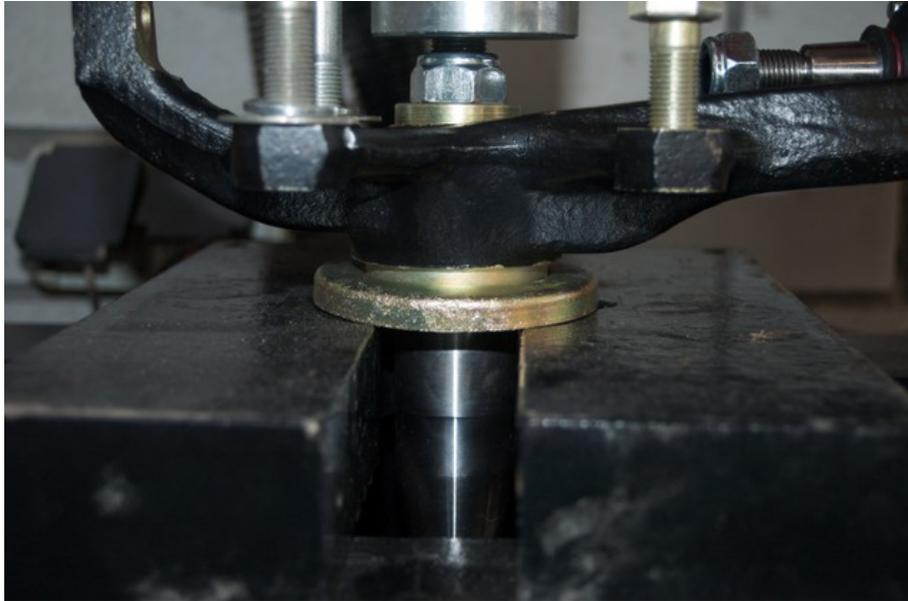

Last week I got the last two missing thrust washers for the front lower wishbones. Eager to do something I assembled the left side at the front. Should have been an easy job, but I had a hard time putting the inner thrust washers in, because the wishbone is a '*GD-fit*'. Took me the best part of an hour which should have been a minute job.

The other wishbone is even worse, something which I already noticed when

fitting the GD brackets to them. I think I'll have to construct some sort of temporary press to push the wishbone arms a bit apart to be able to fit the right side.

On the other hand, pressing the water deflectors on to the uprights **was** an easy job, using the press.

I'm running out of nordlock washers, so I'll order a few next week. Once I have them I can finish the whole front-end I guess. I had planned to do the rear-end first, but I think I'll create the same wheelbarrow as Andy did.
